Abstract

Our society new where technology has touched every cell of it is becoming even more virtually from where fashion is Selfie therefore be shooting themselves, a modern trend which has involved the whole society on the plates as Instagram, Facebook, Twitter, Snapchat, etc. Art selfie is one that many people have practiced and perfected over the years, but knowing what relationship they have with this new generation of virtual relationship remains a difficult task as important as well. This study aims to explore the selfie as a reflection of low self-esteem because the mania for photographing herself, is a pathology of the syndrome in search of a stable personality. Target group of this study were middle school students "Ahmet Dakli" in Elbasan, where 100 participants aged 16-18 years from where 39 participants were male and 61 female. They were asked to fill the Rosenberg Self-Assessment Inventory (Rosenberg Self-Esteem Inventory, 1965) within ethical standards. After analysis of the data showed a positive correlation between connectivity Selfie – Self-Esteem which holds that studies to date have shown that there is a connection between the selfie mania and self-esteem. Out of the sample obtained in this study show that individuals are looking for a better image of themselves as self-images contradict the image of a secure existence, through fixing a few moments as a symbol of an attempt to establish an identity consistent, full realized. The pathology of this syndrome is the search for a stable personality. Of course we are talking about the first research on this phenomenon should probably be more careful diagnostic categorization and labeling.

Key word: Self-esteem, selfie-mania, adolescent

Introduction

Overview of the problem of study

Each of us in one way or another is fascinated by the pictures on the fact that consists of a tow universal and this is explained very simply: just a shot we all encourage curiosity to see how we have come despite the reactions of each of us They are subjective and are related to image internal, mental scheme that we perceived ourselves having to do with how we see ourselves and how we want others to see us. Photography is seen as a powerful means of expression, as a symbolic language to express what cannot be said in words, and as a stimulator of emotions and behaviors about which often are not aware of. The first to have captured value therapeutic photography field of mental health was Hugh Diamond (1856), amateur photographer and psychiatrist at the Psychiatric Hospital Surrey County Lunatic Asylum, first using photographs of his patients as a diagnostic tool for identifying mendore. Vetêm of various diseases in the 70\textsuperscript{th} century XX was officially recognized therapeutic power of photography thanks to the article "phototherapy" by Judy Weiser (1975, hence the use of photography within the psychotherapeutic process as a tool for self-review. Selfie term means "photographic self-portrait," Well-spoken to people who post pictures of themselves and photos on social networks. Among experts argued that such a picture is made in America in 1839 by Roberto Cornelius, an American pioneer of photography. Grand Duches Anastasia Nikolaevna at age 13 was one of the first teenagers used the mirror to photograph themselves
in 1914. The term "Selfie discussed first by photographer Jim Krause in 2005, although the picture in the genre of dating using selfie wide of the term. In 2010 Selfie had gained a wide popularity in social media. According to a study by Jillian McHugh on 3 April 2013, two thirds of women aged 16-35 make selfie order posting on Facebook. In November 2013, the word "selfie", is declared as the "word of the year" by the Oxford English Dictionary. Art selfie is one that many people have practiced and perfected over the years, although the habit of publishing photos on social networks was born in 2000 with the creation of the first areas in social networks.

The trend of shooting ourselves is back in vogue, also tend to Albanian teenagers to stop this study will specifically be exploring the selfie as a reflection of low self-esteem and narcissism. In fact, traditional ignores narcissism contact with others, the person itself creates an exaggerated self-image. In Greek mythology narcissus so much in love with his own image reflected in the water that spellbound with this love, lost and falling into the river where self-reflected. Network social networks can be conceived as a large mirror narcissist, to tell others who you are as valid and able to communicate those aspects of yourself emotionally and often unrealistic, avoiding the difficulties of coping through direct contact. So anyway avoids individual real contact, directly with another, and seeking to "sell" themselves another, more perfect. It seems that social networking presents an overview and a mask at the same time. Studies show that spending more time on Facebook by posting narcissist self-portrait trend is increasing worldwide.

If you ask a link between Selfie-Syndrome and psychopathology, this leads to criteria of addiction, mood disordered situations, obsessive thoughts, obsessive-compulsive disorder. Certainly seeing this phenomenon in this context we are talking about research money should probably be more careful diagnostic classification and labeling.

Selfie-mania influence on adolescent self-esteem
In the minds of individuals who like self-portraits publication there is something wrong. This is the opinion of some researchers that American Psychiatric Association in a study recently pointed out that this is explained by a wish ill to make files yourself and then you publish them on the web and this serves to compensate for the lack of confidence. The first indicator that pushes the individual to selfie is a strong will of the person to tell the world: "I'm here and I'm doing this." Studies to date have shown that there is a connection between the selfie mania and self-esteem. People who make picture yourself are looking for a good image for themselves. Young people, especially teenagers, do not feel you realize and it causes a vague idea about yourself. The cause of the first is a problem of identity as opposed self-portrait image of a precarious existence, through fixing a few moments as a symbol of an attempt to establish an identity consistent, complete and successful. Allegations of social context require an ideal person and it brings uncertainty, which pushes toward creating a perfect image for yourself seeking to stop now. The photos are as a means to demonstrate the existence of a person. The pathology of this syndrome is the search for a stable personality. Individuals have weak personality and constantly seek confirmation through likes or comments to understand who they are and they're worth. Art selfie is one that many people have practiced and perfected over the years, where today more than 31 million people worldwide are constantly posting pictures of themselves, so that it has turned into a desire-compulsive where already under a recent study by the Pew Research Center shows that 91% of teenagers post their images continuously in social media so compulsive. According to Pamela Rutledge PhD, Dean of the Faculty of Media Psychology program at the Massachusetts School is a post selfies empowering act for an image of himself alienated from where Samantha, a 19-year-old girl claimed that why it was posting so compulsive photo of themselves on social media was the satisfaction he received when taking Like and positive reviews for her image. According Dr. Weber girls who repeatedly make selfies struggle with low self-esteem. Thinking of others has been a part of identity development for more than a century of by Andrea Letamendi Ph.D, a doctor of psychology at UCLA, concluded that by posting pictures so compulsive individuals reflect low self-esteem and strengthen the influence of others on their lives. Dr. Letamendi claims that individuals who tend to have low self-esteem and are depressed are more likely to engage in making self-portraits. Social networks have changed the way we communicate and keep in touch with friends all
over the world, but also are undeniable and, unintended consequences arising from their excessive use. Well, according to the researchers, the excessive use of social networks can be associated with several psychiatric disorders, from where, according to studies conducted in 2010 at the University of York which examine the social network connection self-concluded that users of social networks They tend to have narcissistic personality and low self-esteem. According to a search of Amanda Forrest of the University of California and Joanne Wood University of Waterloo, published in Psychological Science, people with low self-esteem tend, inter alia, to post pictures: they tend to criticize those who should be their friends and highlight the negative aspects.

When we do we look very attractive Selfie in most cases due to the effects of technology. Even doctors give selfie alarm that reflects the lack of confidence and that many individuals are inclined towards plastic surgery according to the findings of a study that took into account the 2700 cases treated by surgeons specializing American interventions of facial plastic surgery. Mania to photograph themselves, is a pathology of the syndrome in search of a stable personality.

Self-esteem is a very broad term for how good or bad we feel about ourselves, and it can generally vary as per time. For example, if you fail a test it may be upsetting, but ultimately a grade doesn’t determine who you are. People who have low self-esteem commonly have a very pessimistic outlook and are often quite self-critical, withdrawn socially, and are overwhelmed with feelings of inferiority. A person with low self-esteem may them feel better. So they rather don’t focus on more important ways of changing their negative self-place importance on their looks, thinking that taking and posting selfies will help image such as self-acceptance, self-compassion, and self-respect which is undesirable. This study is an innovation for our society in the context of clinical studies.

**Definition of terms and their operationalization**

Self-esteem: In sociology and psychology, self-esteem reflects a person's overall subjective emotional evaluation of his or her own worth. It is a judgment of oneself as well as an attitude toward the self. Self-esteem encompasses beliefs about oneself, (for example, "I am competent", "I am worthy"), as well as emotional states, such as triumph, despair, pride, and shame. Smith and Mackie (2007) defined it by saying "The self-concept is what we think about the self; self-esteem, is the positive or negative evaluations of the self, as in how we feel about it. Self-esteem is attractive as a social psychological construct because researchers have conceptualized it as an influential predictor of certain outcomes, such as academic achievement, happiness, satisfaction in marriage and relationships, and criminal behavior. Self-esteem can apply specifically to a particular dimension (for example, "I believe I am a good writer and feel happy about that") or a global extent (for example, "I believe I am a bad person, and feel bad about myself in general"). Psychologists usually regard self-esteem as an enduring personality characteristic ("trait" self-esteem), though normal, short-term variations ("state" self-esteem) also exist. Synonyms or near-synonyms of self-esteem include: self-worth, self-regard, self-respect, and self-integrity.

Selfie - mania: Selfies are photos of a person which usually consist of up-close angles of a person’s face. The term selfie has become so immersed in our daily use vocabularies now, that not only has it officially entered into the Oxford English Dictionary, but “selfie” was Oxford English Dictionary’s Word of the Year for 2013. It is described as when an individual holds a camera or smartphone at arm’s length and takes a picture of their face. But honestly, some of these may come across as awkward. There tend to be various poses including the discrete pouting, the ‘duck’ face or lips pose, the funny-trying-to-be-cute face, etc.

Adolescence: Adolescence describes the teenage years between 13 and 19 and can be considered the transitional stage from childhood to adulthood. However, the physical and psychological changes that occur in adolescence can start earlier, during the preteen or "tween" years (ages 9 through 12). Adolescence can be a time of both disorientation and discovery. The transitional period can bring up issues of independence and self-identity; many adolescents and their peers face tough choices regarding schoolwork, sexuality, drugs, alcohol, and social life. Peer groups, romantic interests, and external appearance tend to naturally increase in importance for some time during a teen's journey toward adulthood.
Methodology:
The purpose and objectives of research:
- To explore the correlation relationship between selfie mania and self-esteem.
- This study is an innovation for our society in the context of clinical studies.

The focus of research:
- This research will be focused on adolescence:
- By involving in the sample only the adolescents 16-18 years old.

Sample
Target group of this study were middle school students "Ahmet Dakli" in Elbasan, where 100 participants aged 16-18 years from where 39 participants were male and 61 females.

Study measuring instruments
Instruments used for evaluation Self-esteem in adolescents selected for this quantitative study are:
1. Rosenberg. inventory
Self-esteem is typically assessed using self-report inventories. One of the most widely used instruments, the RSES (Rosenberg, 1965) is a 10-item self-esteem scale scores that requires participants to indicate their level of agreement with a series of statements about themselves.

Results
After analysis of the data showed a positive correlation (tab.1) between connectivity Selfie – Self-Esteem which holds that studies to date have shown that there is a connection between the selfie mania and self-esteem.

Out of the sample obtained in this study show that individuals are looking for a better image of themselves as self-images contradict the image of a secure existence, through fixing a few moments as a symbol of an attempt to establish an identity consistent, full realized.

The pathology of this syndrome is the search for a stable personality. Of course we are talking about the first research on this phenomenon should probably be more careful diagnostic categorization and labeling.
